

A Coronavirus Vaccine Won't Save Us

William Hasteline, cancer, HIV/AIDS, and human genome projects researcher has said that we “should not count” on a vaccine to save the population from COVID-19. Due to the nature of the coronavirus, it is unlikely that a vaccine will help. Sars-COV2 is a virus like the common cold that can mutate, and for this reason it is difficult to create an effective vaccine. Hasteline is not the first to point out that a vaccine is likely not a solution to the pandemic.

William Haseltine, a groundbreaking researcher of cancer, HIV/AIDS and human genome projects, said the better approach now is to manage the disease through careful tracing of infections and strict isolation measures whenever it starts spreading.

Top HIV scientist says he wouldn't count on a vaccine for coronavirus soon– Reuters

Hasteline has said that those who have been exposed to the virus should be social distancing and isolating. China and other Asian countries have done the best at flattening the curve, and the US, Russia, and Brazil have been among the worst.
