Coronavirus Death Toll Surpasses One Million Worldwide

More than a million people have died from coronavirus according to a count from John Hopkins University. The database for the coronavirus death count comes from the WHO, the U.S. and European CDCs, China's national health authority, and other sources.

Many health officials say that the death toll is likely significantly higher. It's thought that countries such as Syria and Iran have significantly underreported death rates. That being said, there are also several cases of countries marking deaths as COVID deaths in any case where a patient tests positive for COVID-19 at the time of death, even if it is not the leading cause of death.

> *"When you count anything, you can't count it perfectly but I can assure you that the current numbers are likely an underestimate of the true toll of COVID."*

It's extremely difficult to get an accurate worldwide death count. The U.S holds more than one-fifth of all deaths, more than any other country in the world, followed by Brazil and India, respectively. As of now, the virus shows no signs of slowing. Many countries that were thought to have cases under control are now having second waves. India is currently recording the most amount of new cases a day.

Health officials think it is likely that the death count may

reach two million before a vaccine is readily available.

If you're worried about coronavirus, the best thing you can do is focus on maintaining a healthy immune system through a healthy gut microbiome. Check out this article to learn how to heal the gut.
