

Florida Bill 1558 Would Make HPV Vaccine Mandatory for School Children

Florida has introduced Senate Bill 1558, legislature that would make the HPV vaccine mandatory for public school children. The bill would mimic similar vaccine mandate laws in Rhode Island, Virginia and Washington D.C.

Florida's HPV vaccine rates are lower than the rest of the country. Sen. José Javier Rodríguez (Dem) introduced this bill on January 4th. If it's passed the bill is said to be titled "Women's Cancer Prevention Act". It would begin taking effect July 1st of 2018.

The good news is that only 1 in 5 parents believe the mandate to be a good idea, according to the journal *Cancer Epidemiology, Biomarkers & Prevention*.

From Dr. Mercola:

Review of HPV Vaccine Trials Conclude Effectiveness Is Still Unproven

Last year, a systematic review¹⁰ of pre- and post-licensure trials of the HPV vaccine by researchers at University of British Columbia showed that the vaccine's effectiveness is not only overstated (through the use of selective reporting or "cherry picking" data) but also *unproven*. In the summary of the clinical trial review, the authors state it quite clearly:

"We carried out a systematic review of HPV vaccine pre- and post-licensure trials to assess the evidence of their effectiveness and safety. We found that HPV vaccine clinical

trials design, and data interpretation of both efficacy and safety outcomes, were largely inadequate. Additionally, we note **evidence of selective reporting of results from clinical trials**(i.e., exclusion of vaccine efficacy figures related to study subgroups in which efficacy might be lower or even negative from peer-reviewed publications).

Given this, the widespread optimism regarding HPV vaccines long-term benefits appears to rest on a number of unproven assumptions (or such which are at odds with factual evidence) and significant misinterpretation of available data.

For example, the claim that HPV vaccination will result in approximately 70% reduction of cervical cancers is made despite the fact that the clinical trials data have not demonstrated to date that the vaccines have actually prevented a single case of cervical cancer (let alone cervical cancer death), nor that the current overly optimistic surrogate marker-based extrapolations are justified.

Likewise, the notion that HPV vaccines have an impressive safety profile is only supported by highly flawed design of safety trials and is contrary to accumulating evidence from vaccine safety surveillance databases and case reports which continue to link HPV vaccination to serious adverse outcomes (including death and permanent disabilities).
