Johnson & Johnson Covid Vaccine Linked to Neurological Disorder

The FDA has added a warning of an increased risk to Guillain-Barre syndrome following the Johnson & Johnson Covid-19 vaccine.

Guillain-Barre syndrome is a rare neurological disorder that causes nerve damage and can result in paralysis.

> *Based on an analysis of Vaccine Adverse Event Reporting (VAERS) data, there have been 100 preliminary reports following vaccination with the Janssen vaccine after approximately 12.5 million doses administered.*

> *Johnson & Johnson vaccine linked to rare cases of autoimmune disorder*

The cases of Guillain-Barre syndrome typically occurred two weeks after vaccination in males 50 and older, said the CDC.

The rate of reported cases of Guillain-Barre currently exceeds the “background rate” or the number of cases reported before the COVID-19 vaccine was introduced.

The syndrome is also a side effect of other vaccines like shingles and the flu.

The AstraZeneca vaccine has also been linked to cases of Guillain-Barre syndrome.
