What Will Vaccine Passports Lead to?

Russell Brand shared his thoughts on the prospect of vaccine passports in a recent video while examining some of the problems with tracking those who are vaccinated.

One of the biggest problems with the vaccine passport is how the vaccine data will be controlled, and who will control it. In the US, we don't have a universal health care plan, and consequently, we don't have a database to store information like that. Because of this, big tech has since stepped in with its own ideas for databases to track those who are vaccinated and those who aren't. To those who pay attention to the track record of big tech, this is extremely concerning. These companies don't have a history of protecting the best interest of the people.

Additionally, the government itself has a poor track record of keeping its word. With promises that something like a vaccine passport would only be temporary, maybe for a year or so many people are reluctant to trust this based on experiences such as the patriot act following 911.

Of course, not everyone wants or is able to get the vaccine. As Brand says in the video, which you can watch below, the concept of vaccine passports raises fears of a "two-tier society" in which those who are vaccinated get to enjoy everyday things like music and sporting events, traveling, or

going to the movie theatre, and those who aren’t vaccinated, are shunned from activities that are considered basic freedoms. This is an even bigger problem in a world where we are already in many ways divided like this. Marginalized communities are likely the ones who would pay the consequences of not getting vaccinated. Rather unwilling or unable, many marginalized communities have good reason to reject the vaccine with a history of being hurt by our government and health care systems.
